NOVELTY - Insect bait (I) comprises a plurality of amino acids (A), a sugar (B) and a preservative (C).  
DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for  
(1) an insect bait (II) comprising a plurality of amino acids (A) (where one of the amino acids is asparagine) and a sugar (B);  
(2) controlling insects at a location; and  
(3) the preparation of granular insect bait.  
USE - Application of (I) in a location is useful to control insects (claimed) e.g. ants (preferred), flies, silverfish or roaches. (I) is also useful as an insect feed that provides an attractive and nutritious food source for insects in entomological research laboratories.

TECH

UPTX: 20040326

TECHNOLOGY FOCUS - ORGANIC CHEMISTRY - Preferred Composition: At least one amino acid in (I) is **asparagine**. (A) comprises 2-7 g/100 ml of **insect bait**. (B) comprises 20-60 g/100 ml of **insect bait**. The preservative is sodium benzoate, citric acid, disodium octaborate tetrahydrate or a mixture of sodium benzoate and citric acid. (I) further comprises an insect toxicant (disodium octaborate tetrahydrate, thiamethoxam (both preferred), orthoboric acid, borax, imidacloprid or indoxacarb) (preferably an **insect growth regulator**) at a concentration of 1-100 ppm of **insect bait**.

Preferred Process (claimed): Controlling **insects** at a location comprises

- (a) sampling nectars and/or honeydews from the location;
- (b) determining the compositions of the nectars or honeydews;
- (c) formulating a mimic from the compositions;
- (d) combining the mimic with an insect toxicant; and
- (e) applying the mimic and insect toxicant combination to the location.

Preparation (claimed): Preparation of granular insect bait comprises

- (a) mixing a lipid-containing substance and (I) with a granular carrier until the carrier has absorbed at least a portion of the mixture; and
- (b) subjecting the carrier to heat until it retains about 8-13% moisture.

Preferred Components: The carrier is corn grits and the lipid-containing substance comprises oil (preferably olive oil).

AB An ant bait is claimed, comprising a granular body composed of a swollen liquid absorbing polymer carrying an insecticide (e.g. fipronil at 0.002%). The composition is claimed to be useful for controlling ants, e.g. Tetramorium caespitum, Formica japonica. The bait is convenient for ants to eat; it is composed of a liquid absorbing polymer in a stable state, and can be formulated as a gel, which can act effectively on a variety of ants including honey-sucking types. It can be produced using conventional techniques at low cost, and can be combined with baits in other dosage forms, exerting attractant effects on a wide variety of ants. Other constituents can include potassium sorbate, sorbitol, **asparagine**, glutamine and glycerol.
